U8903B

Performance audio analyzer

Introduction

Make multi-functional and higher-performance audio measurements with the U8903B audio analyzer. With the extremely low residual distortion of < -110 dB, the U8903B allows you to measure the most demanding audio devices with high accuracy. Perform audio measurements by making the highest resolution two-channel measurements available when you expand your bandwidth to 1.5 MHz with an option or more, the U8903B audio analyzer offers you a configurable audio test solution to meet your specific audio application needs.

Expand Your Options to Meet Your Application Needs

Configurable measurement channels

The U8903B audio analyzer can be configured to 4 or 8 analog analyzer channels. The instrument can simultaneously measure all channels, making the U8903B the ideal choice for multichannel systems such as 5.1 or 7.1 surround sound.

Figure 1. The U8903B's GUI, showing 8 analyzer channel measurements.

1.5 MHz wide bandwidth

The U8903B comes with a wide bandwidth option (N3431A), which expands the analog input bandwidth up to 1.5 MHz, with 24-bit resolution and two-million-point FFT. This option is ideal for looking at the spectrum from Class D amplifiers or switching supplies where frequency components or noise well above the audio band can have a detrimental effect on audio quality. It is also suited to applications where low-frequency spectrum analyzers were previously used. This option is only available for the two front panel analog analyzer channels.

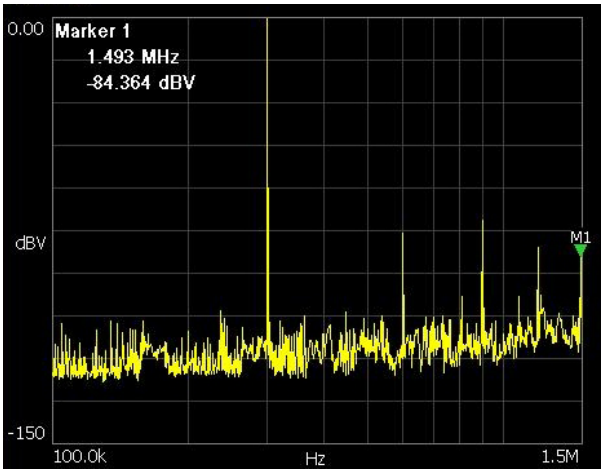

Figure 2. This screenshot shows an FFT plot of a 300 kHz source and the U8903B's unique ability to measure the 5th harmonic with unprecedented resolution.

Voice quality with POLQA

The U8903B audio analyzer now offers the ITU-T standard perceptual objective listening quality assessment (POLQA), which is also known as ITU-T P.863.

POLQA works by comparing a degraded (usually by typical network transmission interferences) or processed signal to the original reference signal. The perceptual differences between the two signals are then rated based on the mean opinion score (MOS) test, which uses a scale from 1 (bad) to 5 (excellent).

POLQA comes with improvements over its predecessor, PESQ (ITU-T P.862), and has been extended to handle higher bandwidth audio signals, supporting measurements in the common audio bandwidth carried by telephone networks (300 Hz to 3.4 kHz) as well as wideband and super-wideband speech signals (up to 14 kHz) needed to assess HD voice quality. With POLQA, the U8903B is suited for testing 4G/LTE and 5G mobile phone network equipment, VoIP phone and network equipment, and HD voice test applications.

Advance Your Measurement Testing

Low residual distortion

The U8903B comes with extremely low residual distortion and noise. The residual distortion is < –110 dB, enabling the measurement of the most demanding devices. This performance is available for up to 8 channels simultaneously.

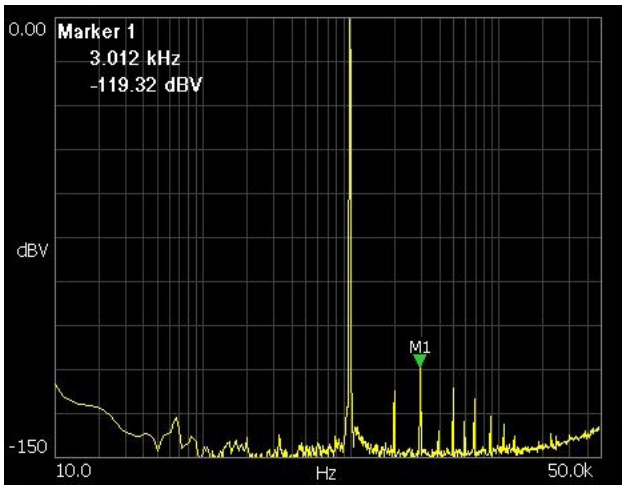

Figure 5. An FFT plot shows the residual distortion

Test sequence control

The built-in test sequencer allows users to create flexible and easy-to-use test sequences that automate testing and provide test reports. This function removes the need to write complicated programming code or to purchase an additional external controller. Users can set up and define the types of measurements and define Pass/Fail decisions, reducing test development time and test time for the device-under-test (DUT). The test sequence function operates with all options and supports voice quality analysis.

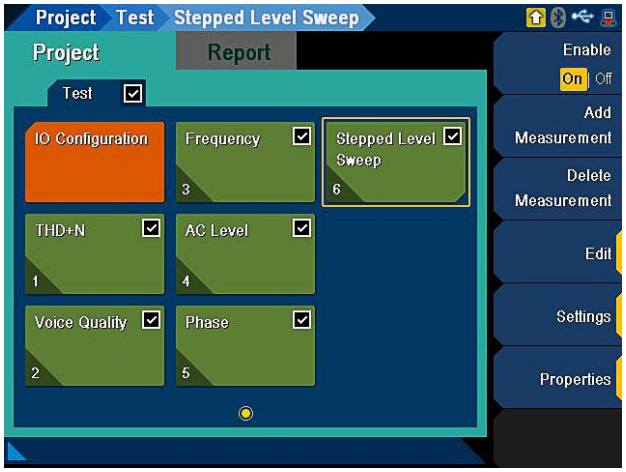

Figure 6. The test sequence control function comes with a selection of pre-configured measurements. It allows users to select the most frequently used test sequences for their daily measurement.

True-RMS detection

To accurately characterize signals with high noise content, true-RMS detection is required. The U8903B employs true-RMS detection for all signals with crest factor less than three. In addition, quasi-peak detection (CCIR 468-4) and peak-to-peak detection are also available through softkey selections.

Expand Your Digital Audio Test Capabilities

Cover your application needs with multiple digital audio interfaces

Test a wide range of digital audio applications with the industry's standard interfaces: AES3/SPDIF and Digital Serial Interface (DSI). Used in the testing and validation of consumer electronics and digital audio-related ICs, both digital audio interfaces are available with the U8903B Option DGT. The U8903B also supports multiple DSI formats, such as I2S, Left Justified, Right Justified, and DSP. These formats are suitable for most digital audio design and verification applications.

Measure more applications with a wide logic level input range

The U8903B comes with completely variable logic I/O levels between 1.2 V and 3.3 V, offering the ultimate compatibility with current and future devices. In addition, the U8903B-105 DSI cable (optional accessories) is designed to make connections between the audio analyzer and the DUT extremely simple. The cable provides a convenient connection to the 25-way DSI connector on the rear of the instrument. The other end of the cable offers all the data and clock lines on individual BNC connectors for quick and easy connection to the DUT.

The U8903B also comes with a mode to help customers transition to the new generation of audio analyzers. This mode allows the new U8903B to mimic the legacy audio analyzer, performing measurements and even displaying the same GUI measurement screen as the legacy audio analyzer. For customers currently using the legacy audio analyzer in their test rack, the U8903B also comes with a built-in code emulator that automatically converts the code directly into SCPI commands, the language used by the U8903B.
